<b>Description:</b>	<p>Hi,</p> <p>I installed version 1.5.0 via homebrew on MacOS and installed "Linux Libertine" in /Library/Fonts When compiling an AMC-TXT project I get:</p> <pre>&lt;pre&gt; VAR: project:moteur_latex_b=xelatex ERR: Les polices de caractères suivantes ne semblent pas installées sur votre système : &lt;b&gt;Linux Libertine&lt;/b&gt;. Variables : &lt;/pre&gt;</pre> <p>I can live without Linux Libertine, and anyway I would like to use AMC-TXT to prepare my exams, but customize the result. Is there a template or something equivalent that I can modify in order to have control on the DOC-filtered.tex that I guess is the result of the .txt conversion?</p> <p>Thanks in advance,</p> <p>PS: I write in english so that it can help more people, maybe I shouldn't</p>		

### History

I went back to <https://github.com/maelvls/homebrew-amc> and saw that I missed this:

```
<pre>
brew install homebrew/cask-fonts/font-linux-libertine
</pre>
```

which solved the font problem.

Nonetheless, I'm still curious about templating AMC-TXT format. Any pointer?

- % Done changed from 0 to 100

@DOC-filtered.tex@ is made from the AMC-TXT source file without any template. This is done with @AMC/Filter/plain.pm@.
