Description:	For each "Update Document" command executed on the latex file, can we have a feature such that AMC stores the input file with a version number (1,2,3,...) in a subfolder and add this version number as a binary box on the PDF? With this, when we feed the scans after the test, AMC can use Layout Data derived from this version of the input file. And users don't have to be paranoid about accidental changes to the input file while modifying marking scheme.		

History
