Looks like the RPM package of auto-multiple-choice is not built for Opensuse 13.1. Alexis will be able to resolve it. In the meantime can you try to build the RPM package from precompiled sources as described in http://home.gna.org/auto-qcm/download-opensuse.en

There were some changes in packages names and LaTeX paths in OpenSUSE 13.1, that made the SPEC file for AMC invalid.
I tried to correct this. Can you try with the newly built RPM package on OpenSUSE Build Service?
