Description:	Such a "move forward button in the zoom window" would help save a lot of click to make sure all the marks have been taken into account and recognized as they have to. Better, the "calage" window could be synchronized with the zoom window, with a move forward button on each (such a button exists already on the calage window). Keyboard shortcut would be welcome too to save some mouse movements and clicks.

I have just noticed that the zoom window move along with the selection in the "diagnostic" selected line. A suggestion would be to advance the calage window as well, at the same pace ... and keep the size of the calage window, not redraw a new one. Thanks again for such a great tool anyway.
