

Auto Multiple Choice - Bug # 704: Cannot use the GUI Project->Open menu if no project present in the project directory.

Status:	Closed	Priority:	Normal
Author:	Alex Alex	Category:	
Created:	02/23/2020	Assignee:	
Updated:	12/21/2020	Due date:	
Description:	<p>My issue is that I don't put my projects in the project directory. I prefer having them in my normal directory structure (in multiple discipline's test directories, next to other tests which are not AMC projects).</p> <p>In which case, AMC doesn't actually let me open them; I had to create a new project (which I will not use) in the MC-Projects directory. This was confusing, and seems a bit silly. Same if the MC-Projects dir is moved or removed.</p> <p>Steps to reproduce:</p> <ul style="list-style-type: none">- Create a new project in directory ~/test/myproject- Move MC-Projects to MC-Projects2 (or simply have an empty MC-Projects).- Open auto-multiple-choice in gui- Do Project->Open- Get error message "You don't have any MC project in directory /home/alexis/work/lycee/applications/AMC!" <p>Expected behavior:</p> <p>Open the normal "Open a MC project" dialog.</p> <p>Workaround:</p> <p>Add an empty folder (I called it "do_not_remove") in the Projects directory (by default ~/MC-Projects).</p>

The development version of AMC is more friendly with directory changes.

However, you can switch to another directory from the open window, and then create a new project (which is a directory with AMC files) in your own directory structure.
