| Description: | That's a <code>_very_</code> minor bug: https://gitlab.com/a10684/auto-multiple-choice/-/blob/master/AMC-prepare.pl.in?ref_type=heads#L958 I believe missing there, for consistency, is <pre><pre> \$out_corrige_indiv = \$prefix . "indiv-solution.pdf" if (!\$out_corrige_indiv); </pre></pre> | | |

That being said, I'm not 100% sure that this code is ever needed. It seems that setting just `project_dir` (a.k.a. `prefix`) in `options.xml` has little impact, since the `doc_` variables are set to a default value in `Config.pm`. For this to work, we would need a "pre" default and a "post" default. The "pre" would be the current `Config::defaults`, and the "post" would infer the value of fields that are not set based on the ones that are.
